

Prevalence of Tuberculosis and Its Associated with Intention to Leave in Nursing Career

Kavin Thinkhamrop

Doctor of Public Health Student

SID: 567110005-7

Background (1)

What is **tuberculosis (TB)** ?

“Tuberculosis is defined as an infectious disease caused by a bacterium, ***Mycobacterium tuberculosis***; that most commonly affects the lungs.”

M. tuberculosis

Background (2)

TB & *Worldwide Public Health Issue*

● **TB** in the world

- 9 million infected
- more than 1 million died

● **TB** in Asia

- 40% of the world's cases were in India and China
- 130,000 cases with 64 million in Thailand; 0.2%

Background (3)

TB *among nurses*

● Prevalence

- Central Brazil 69.5%; n = 128
- Puerto Rico 42.9%; n = 91
- Thailand 03.5%; n = 18,756

● Effect of TB infection

- Health problem
- Intention to leave or Stop working
- shortage of medical personnel

Research question

- Tuberculosis infection rates among nurses as much?
- TB associated with intention to leave in nursing career or not?

Objective

- To determine the prevalence rate of TB infection among nurses in Thailand
- To assess association between TB and intention to leave in nursing career

Materials and methods (1)

- Study design

- Cross-sectional study
- Part of the Thai Nurse Cohort Study (TNCS)

- Sampling method

- stratified random sampling with probability proportional to size of nurses in each 10-year age intervals

- Study outcome

- TB infection during the operation
- Intention to leave (ITL) nursing career within 1-2 years

Materials and methods (2)

Statistical analysis

• Descriptive analysis

- Percentage
- Mean \pm SD; Median (Min : Max)
- 95% Confidence Interval
- P-value

• Bivariate analysis (Crude ORs)

- Simple logistic regression
- p-value < 0.05
- Theories that affect the outcome

Materials and methods (3)

Statistical analysis (Cont.)

● Multivariable analysis (Adjusted ORs)

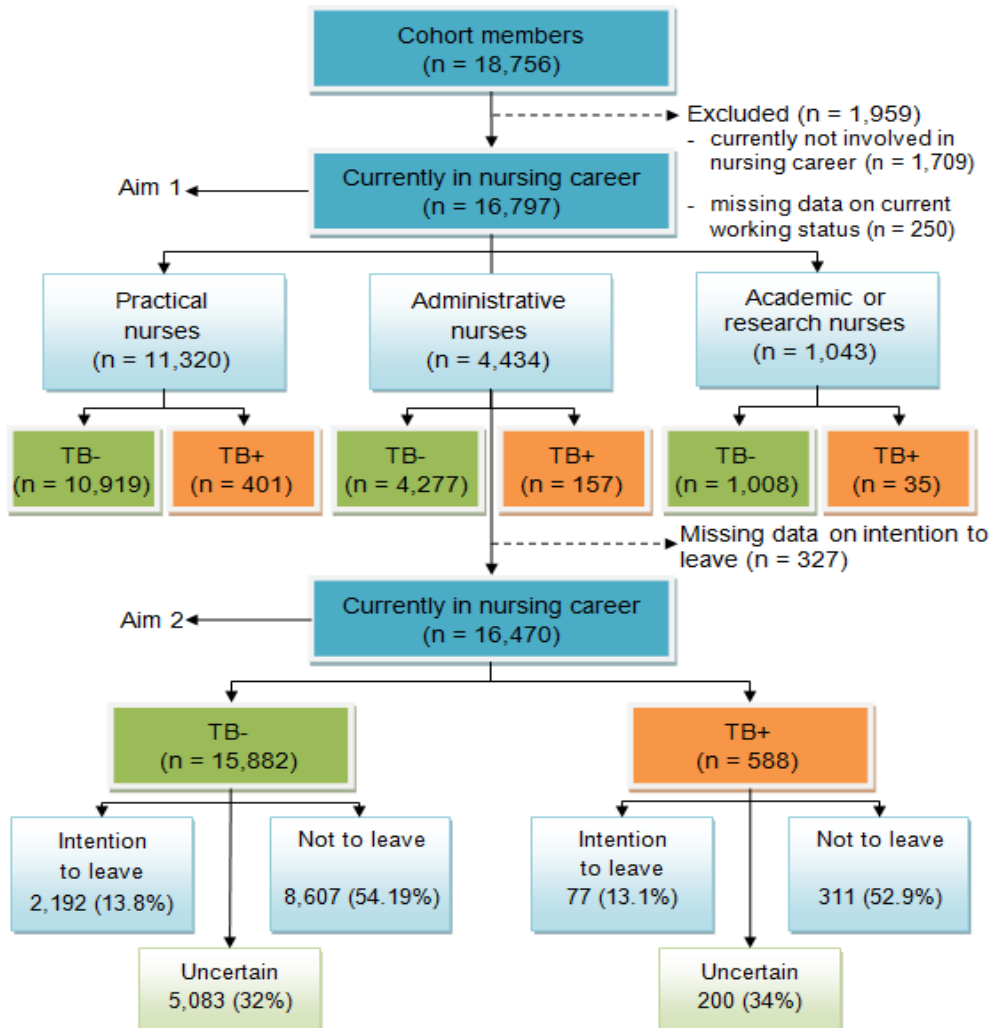

- Multiple logistic regression
- Backward elimination method
- p-value > 0.05 were exclude

● Statistics software

- STATA version 12.0 (*StataCorp, College Station, TX*)

Results (1)

Characteristics of sample

Demographic characteristics

Gender (n = 16,699)

Demographic characteristics

Mean (SD) = 43.2 (9.4)
Median (Min : Max) = 44 (19 : 65)

Age (n = 16,797)

Results (2)

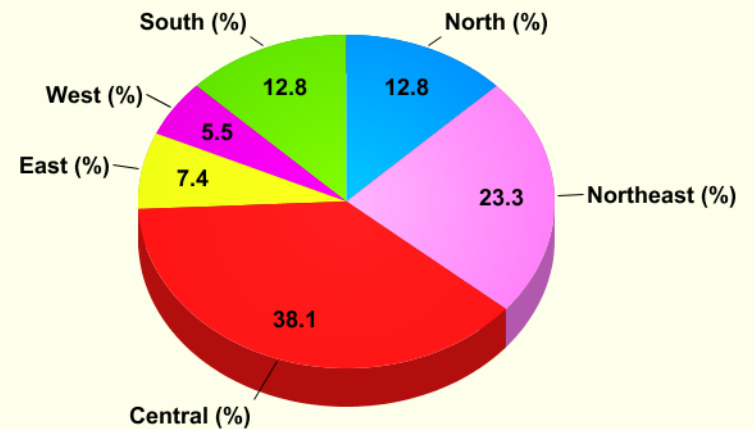

Characteristics of sample (Cont.)

Demographic characteristics

Currently major work position (n = 16,797)

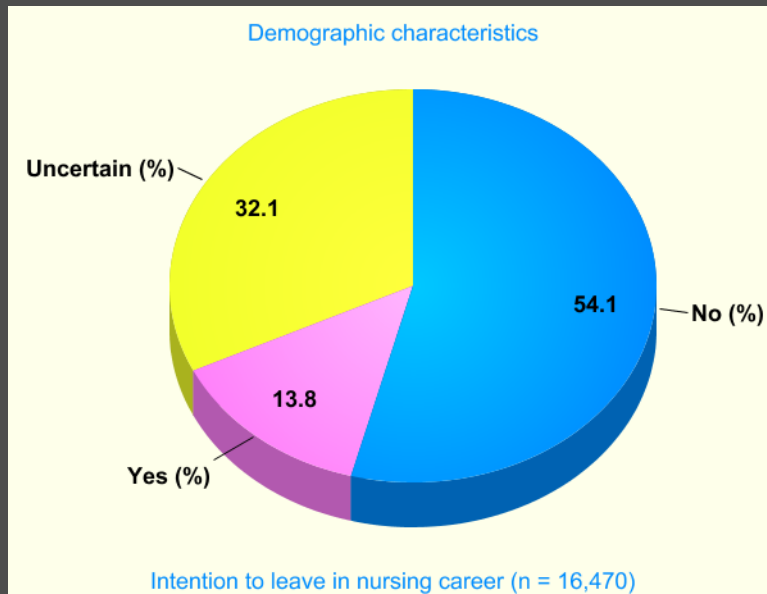

Demographic characteristics

Region of workplace (n = 16,176)

Results (3)

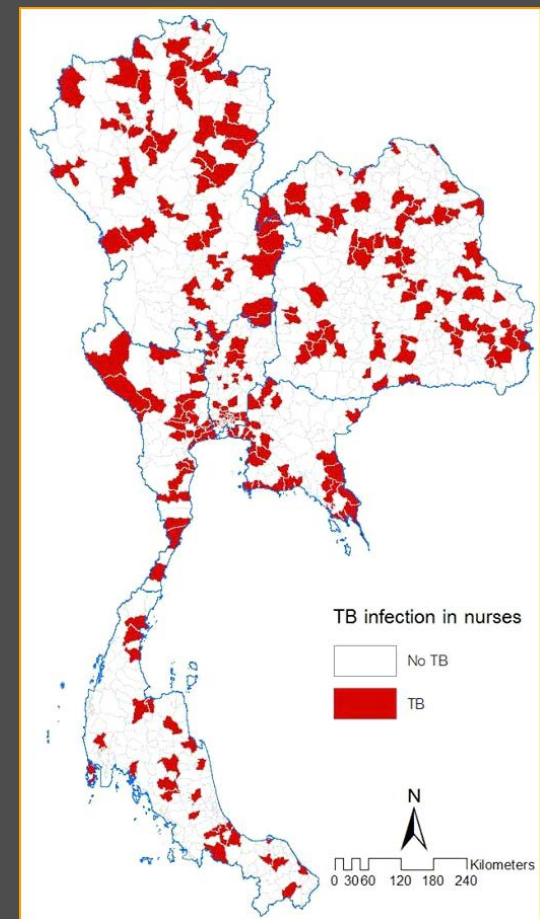

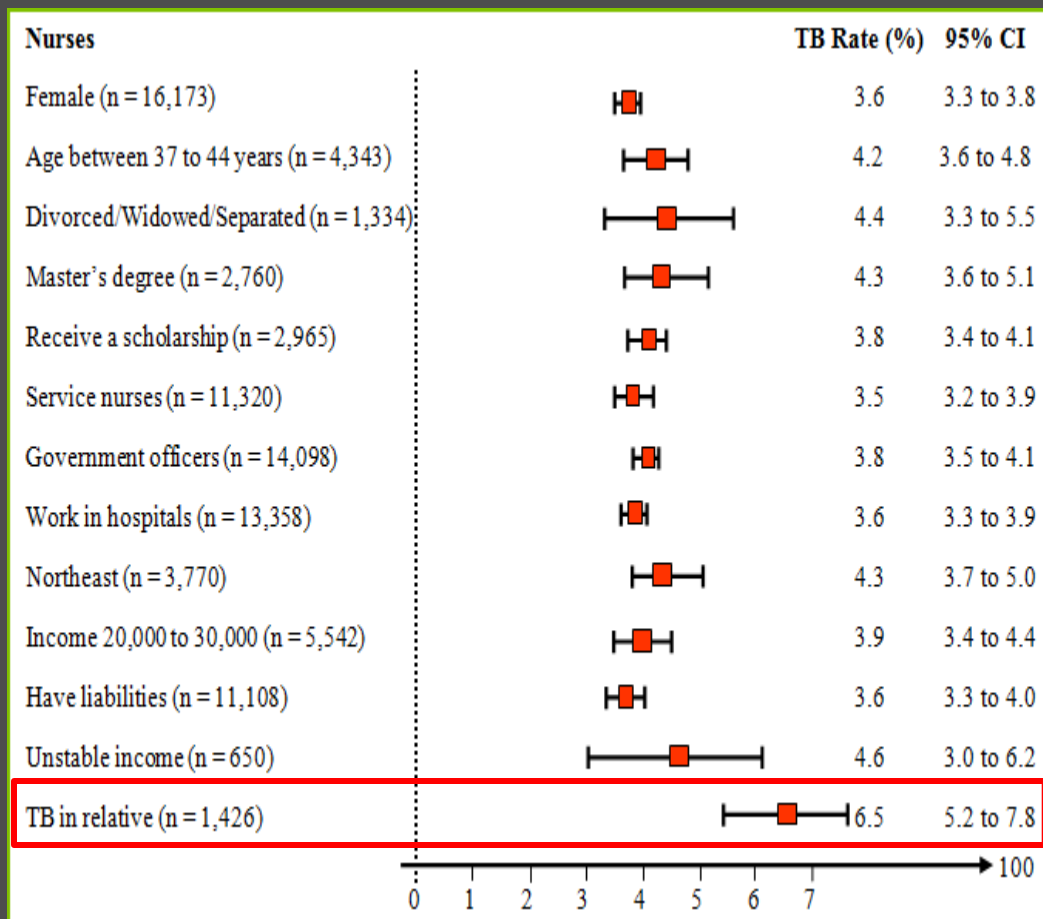

Characteristics of sample (Cont.)

Results (4)

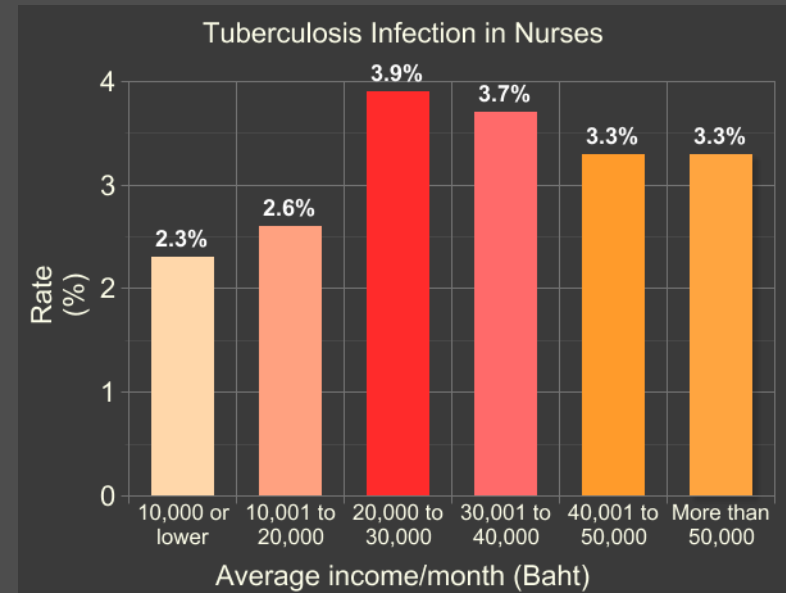

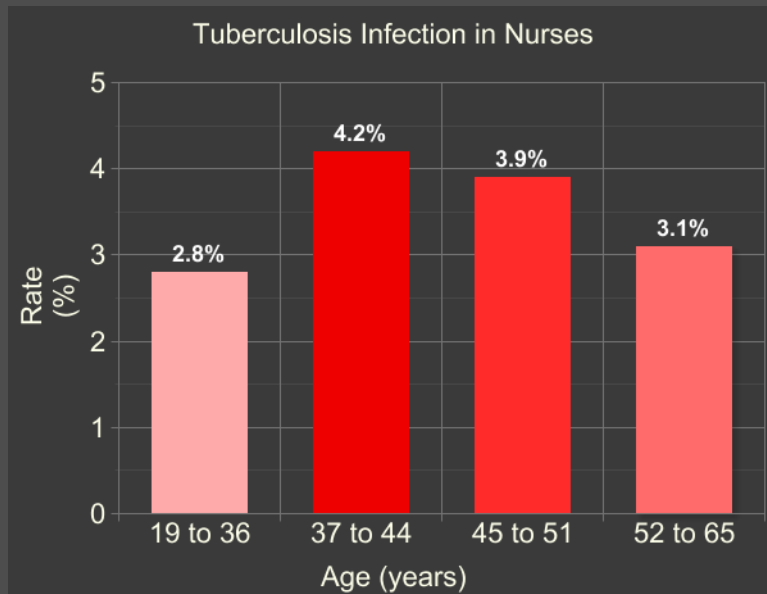

Forest plot of TB infection rate

TB Distribution

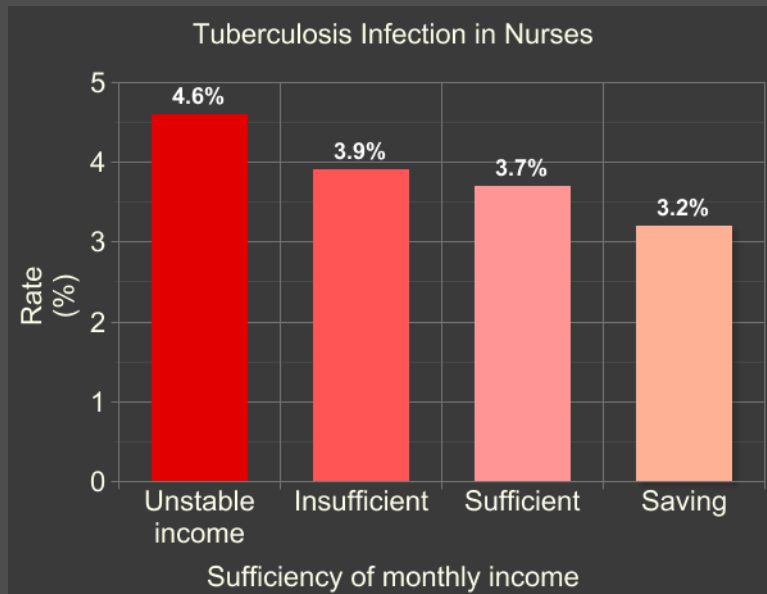

Results (5)

Graphs of TB infection rate

Results (6)

Graphs of TB infection rate (Cont.)

Results (7)

ORs of TB With ITL adjusted for all other factors

Discussion

- Earlier studies found TB infection rates among nurses were high as opposed to this study that found only 3.5% (593/16,797).
- Not found association between TB and ITL in this study and not found reported in other studies as well.

Strength

- Large sample size
- Variety of cultural, well-being and environmental
- Can be a good representative of the population will be able to study and reference.

Limitation

- A large samples may be varying in terms of statistics.
- Data from the study were derived from self-administered questionnaire.
- TB infection was reported by nurses who respondents without medical diagnosis result to confirmed.

Conclusions

- TB infection rate is high in nurses whose relatives have been TB infected, unstable income, and marital status were divorce/widowed/separated, but its was not associated with ITL in nursing career.

However, this study shows that TB infection rates remain high and remains a health problem that needs to be burned. Especially, in medical personals who spend a majority of time with patients
